

# METAREX<sup>®</sup>

ALL WEATHER SLUG AND SNAIL BAIT

## Perimeter baiting ...

**Applying METAREX Slug and Snail Bait early and before the opening autumn rains can save time and money.**

Snails spend the summer resting on posts, stubble, weeds, bushes, and other harbourages in order to conserve moisture and survive the dry summer period.

With the approach of autumn however, cooler moist conditions trigger snail activity and movement down from their summer resting site after the first autumn rains to find food and mate.

Early baiting will kill snails before they have a chance to mate and lay eggs. Applying **METAREX** before the opening autumn rain ensures that baits are present and ready to kill as snails begin to move.

**METAREX** is ideal for early season control because it offers the following benefits;

- **Rainfastness:** **METAREX** will last in wet conditions when other baits fall apart or become inactive, and does not need to be reapplied after every rain event
- **Long lasting weatherproof formulation:** if **METAREX** is visible on the ground it's still active, and unless consumed, will remain so for up to 3 weeks
- Snails find **METAREX** highly attractive and palatable
- **Spreadability:** Every **METAREX** bait stays where it's put without crumbling or turning to powder
- **METAREX** kills slugs & snails quickly, with a high number of bait points and around 3 times the strength of other metaldehyde products

Take control of snails before they invade and apply **METAREX** around fence lines early in the season. This strategy can significantly reduce snail numbers overall, and thereby save time and money.

Treating early with **METAREX** can also eliminate the cost of re-applying other snail baits every time it rains, and may even save the cost of treating the entire paddock later.
